The coronavirus disease 2019 (COVID-19) has been labelled as a global pandemic disease by the World Health Organization. The number of infections in Indonesia rose significantly to 8211 cases, and 689 coronavirus deaths were reported on April 24th, 2020 (CNN Indonesia, 2020). We knew that the Indonesian Government has made numerous strategies to control the spread of infection in our community, but implementation plans were limited in addressing the challenges of stay-at-home policy. These challenges may include economic impact due to COVID-19, struggles for work-from-home, and leaders' ability to influence the society.

Economic Impact due to COVID-19

On March16th, 2020, the Ministry of Administrative and Bureaucratic Reform announced new regulations for controlling the spread of COVID-19 in the community. These regulations explained about the instructions to stay-at-home or work–from-home during the COVID-19 outbreak (Ministry of Administrative and Bureaucratic Reform, 2020). All employees were encouraged to work from home unless they had to be in public areas for reasonable excuses.

Among 273 million of Indonesians instructed to stay-at-home, a major impact may strike the Indonesian economy beyond the spread of the COVID-19 itself (World Population Review, 2020). As a developing country, Indonesia has 760 thousands of self-employed workers who should continue to work outside their home (Abdila, 2020). Although some self-employed workers can create a functional working space at home, they still need financial security which perhaps cannot be as much as when they work outside. Meanwhile, this social distancing regulation has affected many people especially who have to work outside, and thus they become unemployed for a lot of reasons (Nikola, 2020). It was reported 1.9 million of Indonesian people have lost their jobs due to weak management crisis during this pandemic (Shalilah, 2020).

Therefore, addressing the economic impact of COVID-19 could be done through stay-at-home practice. In addition to this, incentives and rewards shall be prepared to protect economic activity (Fenichel, 2013). Lately, Indonesian Government also provided social security program for those affected by COVID-19. The Government released Family Hope Program (Rp. 37.4 trillion), Social Assistance for Staple Food (Rp. 2.2 trillion), Village Fund (Rp. 21 trillion), Cash Labor-Intensive Program (Rp. 16.9 trillion),
Challenges of Stay-At-Home Policy

Overcoming Challenges of Stay-At-Home Policy

Nowadays, people have become more and more aware of their health, but coordination that goes beyond our communities has to be strengthened. The importance of stay-at-home policy has to be reinforced even though it might become challenges during the coronavirus (COVID-19) outbreak.

Stay-at-home policy implementation has become more complex, but the Government still has chances to manage this policy more effectively. Theory of Compliance Management mentions three C’s that support this compliance culture, e.g., communication, confirmation, and correction. These key components have benefits to boost compliance in maintaining daily activities (Lestari et al., 2015). This 3Cs concept can also be used for managing the implementation plans of stay-at-home policy.

Raising public awareness of COVID-19 health issues is not easy as the society may differently interpret the importance of stay-at-home policy for their own health. Therefore, people were urged to follow the Government’s advice and instruction about COVID-19 (Abdi, 2020).

Based on its theory, effective communication shall begin at the top-level management (Bussmann et al., 2019; Hu et al., 2012). Many leaders have their own personal traits and they are not necessarily admirable. Indonesia needs more charismatic, knowledgeable, and enthusiastic leaders to deliver informative speeches as a proactive approach to avoid negative impacts of miscommunication and increase the community compliance as well. The public figures can work with people in the community and influence their health.
behaviours to achieve the desired goals (Nikoloski, 2015; Supriyanto et al., 2020). For example, Tri Rismaharani, a charismatic leader from Surabaya City, East Java, can effectively communicate with the society to follow the government advice as trusted information sources. She also tried to reduce stress by providing certain facilities for low-income communities (Yasmin, 2020).

Confirmation of the continuous monitoring program could be done to equally support preventive, promotive, curative, and rehabilitative measurements. For instance, Indonesia Ministry of Health conducted COVID-19 monitoring program in which all societies could see tracing progress and the government work on https://covid-monitoring.kemkes.go.id/ (Indonesian Ministry of Health, 2020). Meanwhile, in Taiwan, planning, monitoring, and evaluation programs were done to control public attitudes and beliefs towards false information via conventional media (newspapers, radios, TVs) and modern media (internet) as communication and dissemination tools. Besides, these conventional and social media were in use to increase public awareness and participation in health. The Taiwanese Government routinely shared transparency data on health issues and updates of the situations on media (Hsu et al., 2017).

Further, correction involves noticing any changes and providing effective complaint management strategies can be taken to evaluate the stay-at-home policy implementation (Lestari et al., 2015). The assessments by Indonesian Government can be planned and coordinated to ensure that the policy is effective to combat COVID-19.

The COVID-19 pandemic has persistently affected all biological, psychological, social, and cultural aspects. The COVID-19 case fatality rate is higher than the flu (Wahyuni, 2020). Until now, there have been still no medicines proven to treat the disease (Gallagher, 2020). Many people were so overwhelmed by the abundance of stressing information from social media and internet, which poses a major threat to public mental health. They responded differently from feeling low mood, anxiety, panic attacks and sleep deprivation (Elvira, 2020; Dong and Bouey, 2020). The World Health Organization (2020) provided guidelines to support and prevent people from developing mental health issues, for example, supporting each other to respond the impact of stress due to economic loss during the pandemic. On the other hand, motivation or willingness to comply with the policy was the most important factors for successful policy implementation (Weske et al., 2018).

From what have been explained throughout this article, it can be concluded that compliance with stay-at-home policy management involves the role of top management level and exerts incentives to public. Trusted information and supports are required to maintain the society’s mental health and well-being.
