ABSTRACT

Background: Stroke is a medical emergency condition that often causes death and disability recorded worldwide. About 5.5 million people died and 44 million people living with the residual effects of stroke. Stroke results weakness of the extremities and impact from prolonged bed rest that gives one of the complications called decubitus. Decubitus as result of prolonged pressure on the protruding bone surface area, so that depressed area and over time the local tissue is ischemic, hypoxia and develops into necrosis. Cause of the patients’ inability to take care of their own bodies, therefore family caring is important roles in decubitus treatment in stroke patients. Purpose: To collect and analyze the results of research relate the treatment management with family caring methods to prevention decubitus in stroke patients. Methods: this study used a research article from 2015-2021 with a data base of PubMed, google scholar, ScienceDirect, and research gate and using certain keywords. The keywords for this review included decubitus, pressure ulcers, pressure injury, stroke, family caring. Results: The author filtered 315 literature study from four databases (PubMed, google scholar, ScienceDirect and research gate) for review. That as many 15 articles that considered relevant, and 8 articles were included of treatment management with family caring to prevent decubitus for patient stroke. Based on the analysis of 8 articles, the family caring method can reduce the risk of decubitus in stroke patients. Conclusion: The Family caring method can prevent the risk of decubitus in stroke patients. Keywords: decubitus, pressures ulcers, pressure injury, stroke, family caring

ABSTRAK

Kata kunci: decubitus, ulkus decubitus, stroke, pendamping keluarga

INTRODUCTION

Stroke is one of the significant disease problems that occur in the world. Every year, approximately 5.5 million people die, and 44 million people become disabled due to stroke. In the United States, stroke is the third leading cause of death after heart disease and cancer; approximately 600,000 people experience stroke cases, and 200,000 of them experience recurrent attacks (Jessyca & Sasmita, 2021). Meanwhile, in Indonesia, according to Riskesdas data in 2018, 28.5% of patients experienced morbidity caused by stroke, and the rest suffered partial or total disability. Of the 713,783 total stroke cases, only 15% can recover from stroke and disability.

Decubitus or pressure sores are local damage to the skin and sub-dermal tissue and can even attack muscle tissue to bone (Karimi, Yaghoubinia, Keykhah, & Askari, 2018). The protruding soft tissue causes this and the outer surface being stressed continuously (Sari, 2017). Another cause of the occurrence of pressure sores due to the force of friction in between a surface, humidity, poor nutrition, anemia, infection and circulatory disorders. Body parts that often experience pressure sores are the sacrum, heels, elbows, lateral malleolus, and sitting bones (Pokorna et al., 2019).

Patients with moderate to severe disability after stroke are usually very dependent on the help of people around them, especially their families to care for them (Mohamed, 2015). Family caregivers a person who gives assistance or treatment not only physically but also emotionally to family members who can not take care of their own (the patient's stroke) (Kristaningrum et al., 2021). Family caregivers can prevent the occurrence of injuries decubitus in stroke patients through measures of prevention such as direct care, risk assessors, hazard prevention, en-suring comfort, providing a safe environment to help patients with stroke achieve health (Ahmadi & Ogale, 2020). It is so important when treating stroke patients is to encourage early recovery and pre-vent complications (decubitus) (Pitthayapong et al., 2017).

With the growth of knowledge, it's hoped that the prevention of pressure sores in stroke patients by using the family caring method can be carried out optimally. This study aims to identify the intervention of the family caring method, which is considered the most effective method to pre-vent pressure sores in stroke patients.

METHOD

The method used in writing this article is a literature review to obtain the effectiveness of the family caring method in pre-venting pressure sores in stroke patients. The strategy used in the article search is using re-search articles that match the topic in the Google Scholar, Pub-med, Science Direct, and Research Gate data-bases.

The literature review is limited search literature in a span of 6 years (2015-2021) by using the key "pressure sores", "pressure ulcers", "pressure injury", "stroke" and "family caring" with determination questions that follow techniques PICO. Where any question P are all stroke patients at risk of developing pressure sores, I was intervention decubitus prevention using the method of family caring, C is a standard decubitus intervention, O is the risk of pressure sores. The inclusion criteria in this literature review are full-text articles, both in Indonesian and English, published in the last six years. The flow of the journal review is adjusted to the following figure.
Full-text articles examination were undertaken to choose a journal the results of research in accordance with inclusion samples. Fifteen articles were obtained that meet inclusion criteria, and eight articles possessed relevant titles and abstracts about family care in the prevention of pressure sores in patients with stroke.

**RESULT**

Analysis of the 8 articles research into the sample in the *literature review* outlined in the table below:

Elmawati (2019) conducted a study on the relationship between the role of the family and the prevention of pressure sores in stroke patients in the inpatient ward of the Muntilan General Hospital. The sample is 35 caregivers who are waiting for stroke patients. The characteristics of the respondents are mostly male 18 (51.4%), aged 30 years as many as 24 (68.8%), and most are children of patient 23 (65.7%). It was found that p value <0.001 illustrates that the role of the family can reduce the incidence of pressure sores. Interventions to
prevent pressure sores carried out by caregivers include adjusting the sleeping position or suddenly, the position of the body pads that must be fixed. being kept dry, changing diapers every 6 hours, changing positions every 2 hours, and humidity management.

Pitthayapong, et al (2017) with the research title A Community Based Program for Family Caregivers for Post Stroke Survivors in Thailand used a sample of 62 couples (134 respondents) of stroke patients and family caregivers with 31 couples as the intervention group and 31 couples as the intervention group. control group. The characteristics of respondents in the intervention group were 64.74 years old, female 25 (80.6%), and had 23 primary school education (74.2). Meanwhile, in the control group, the majority were female, 26 (83.9%), with an average age of 69.03 years, and primary school education as many as 24 (77.4%). Interventions for preventing pressure sores include increasing caregiver skills (family caregivers) in caring for stroke patients including feeding and preventing aspiration, preventing pressure sores, preventing falls, mobility, and rehabilitation to increase the activity ability of the patient.

Artikel Karimi, et al (2018) with the title Investigating the Effect of Home-Based Training for Family Caregivers on the Incidence of Bed-sore in Patients with Stroke in Ali Ebne Abitaleb Hospital, Zahedan, Iran: A Clinical Trial Study aims to examine the effect of training to treat the incidence of pressure sores in stroke patients. A sample of 70 family caregivers of stroke patients was divided into 2 groups, 35 of which were included in the intervention group, while the other 35 were considered as the control group. The characteristics of respondents in this article are 38.14 years old, most of whom are women (65.7%) with a diploma level of education (44.28%) and 52.8% do not work. This study shows that nursing care training based on home caregivers can be effective in reducing the incidence of pressure sores in patients with stroke, which is one of the most common secondary complications. By providing training in skincare protocols such as washing and protecting the lower skin (including the shoulder and heel sacrum), sensory perception, moisture management, mobility, body position control, and nutritional patterns.

Agustina & Rasid, (2020) stated in their research about the role of 20 pairs of families of stroke patients for the prevention of pressure sores in the inpatient ward. The characteristics of the respondents are mostly 31 women (77.5%) with 22 respondents (55%) having high school education. The role of the family has a positive impact on the prevention of pressure sores in stroke patients. An important aspect in preventing pressure sores is to maintain and maintain skin integrity by conducting an assessment of risk factors and treatment interventions.

Hesamzadeh et al., (2016) examined how the experience of family caregivers influences the prevention of pressure sores. Respondents were 19 family caregivers with 11 women, with an average age range of 21 years to 71 years, namely 44.31 percent. The role of the family has a positive impact in preventing pressure sores in stroke patients, an important aspect in preventing pressure sores is to maintain and maintain skin integrity by conducting an assessment of risk factors and internal factors. Treatment intervention. Caregivers have different experiences from 1 month to 12 years. Treatment for stroke patients includes encouraging physical mobilization, training in physiotherapy, maintaining patient hygiene, and maintaining nutritional patterns.

Article of Hong, et al (2017) entitled Effect of a Caregiver Education Program on Stroke Rehabilitation, aims to evaluate the caregiver education program on the functional recovery of stroke patients and rehabilitation treatment. A sample of 181 respondents with characteristics mostly with 55 respondents is ischemic stroke and received family caregivers as many as 21 respondents and caregivers from rehabilitation centers as many as 60 respondents. Although there was no significant difference, it was found that family caregivers had a positive effect on the functional improvement of stroke patients. As for the care that caregivers can give to stroke patients to prevent pressure sores from occurring, namely increasing awareness through sensory stimulation, sitting and rolling over, axial strengthening exercises, upper extremity exercises, practicing lying down positions. sideways, and humidity management.

Wha, et al.(2015) made a study to find out the comparison of the welfare of patients who are cared for at home by family caregivers or in nursing homes. Of the 22557 elderly stroke patients, 10,789 received care at home by family caregivers. Those who received care at
home by family caregivers experienced increased changes in daily activities. So, it is necessary to develop the care ability of family caregivers, as for the care that will be given to improve the daily activity ability of stroke patients, namely by maintaining and maintaining skin integrity, moisture management, nutrition, stimulation, and change of position.

DISCUSSION
The method in selecting the sample was in accordance with the research standards used. The number of research samples ranged from 19 to 22,557 people. The inclusion and exclusion criteria of the samples varied widely, based on the specific objectives of each study, of course, the researchers had considered carefully so that the sample criteria did not give a negative impact. Influence on research results. Based on the results of 8 studies that have been reviewed, proved that the method of family caring or family caregivers had a positive impact on reducing the incidence of pressure sores in stroke patients. However, this must be supported by assistance from professional experts (nurses) who have received special training and there is a need for a program to provide additional training for family caregivers to support the improvement of family caregivers. functional status and prevention of pressure sores in stroke patients.

Stroke is itself brain damage that appears suddenly, progressive, and quickly due to circulatory disorders of the brain non-traumatic, causing stunted its availability of oxygen and nutrients (Hesamzadeh et al., 2015). The inhibition of the availability of oxygen to the brain can affect the performance of the nerves in the brain, causing various problems (Agustina & Rasid, 2020). Besides stroke can also leave sequelae or disability, it depends on the part of the brain affected by stroke, which can cause disruption of motor function, sensory, and cognitive in the long term (Bucki & Spitz, 2019). Bedrest that stroke patients for a long period of time can lead to suppression of the bone protrusion and causes the body to become ischemic and resulting in skin damage or pressure sores (Agustina & Rasid, 2020).

CONCLUSION
The results of a literature review in 8 research journals related to family caring methods to prevent pressure sores in stroke patients by adjusting the sleeping position, managing humidity, and maintaining skin integrity (keeping the body pad dry, and keeping the skin dry). changing diapers every 6 hours, protecting the lower skin including the shoulder sacrum and heels), changing positions every 2 hours, nutritional patterns (feeding and preventing aspiration), practicing activities to improve daily abilities, and also hygiene for stroke patients.

SUGGESTION
Implementation of interventions from prevention of decubitus in stroke patients should be facilitated by experts or nurses who have been based on the results of the literature review on family caring methods in preventing decubitus wounds in the care of stroke patients has a positive impact. prevention of decubitus understanding and in its subsequent implementation it is better if it has received previous training.

ACKNOWLEDGMENT
Thank you to the STRADA Indonesian Institute of Health Sciences for providing facilities and equipping writers with knowledge so that they can complete this literature review.
