## **EDITORIAL**

The Covid-19 outbreak was first detected in Wuhan City, China in 2019, and was designated a pandemic by World Health Organization (WHO). Almost all countries are also recorded as affected by the COVID-19 outbreak despite the number of cases infected that varies by country. The impact of covid-19 has caused the death rate in various countries to increase, one of which is an increase in the number of sick and death rates in Indonesia. The spread of the covid-19 virus through the airborne makes the spread of risk very quickly from one human to another, this is strengthened if they do not carry out good and correct health protection and promotion. Several agencies or institutions have conducted community service related to basic information about covid, the process of spread, prevention efforts and treatment that can be done by the community if at risk or infected with Covid-19 disease. Another effort made to prevent the increase in covid cases is with early detection and monitoring in areas or areas that are at risk for contracting covid-19, this risk is divided into low, moderate and high risks. This detection and monitoring is done by involving the community as the main partner either done offline or online monitoring in the region. The role of community nurses in prevention efforts is needed by the community to provide good and correct education about covid, not only the impact physically but also psychologically, because not a few of the community decriminalize to the seizure of covid-19, for that is the importance of various social support both from friends and family in prevention and healing efforts.
